

Reed Canarygrass Western Herbaceous Vegetation (Map Code 36)

Location: *Phalaris arundinacea* plants are found intermixed with other emergent wetland species, particularly *Typha* spp., at various sites around the Refuge; a small stand was observed in Leota Bottom. However, two stands that meet the minimum mapping unit of 0.5 hectares are present in the unnamed drainage near the main Refuge entryway, near State Highway 88.

Signature: The signature for this type has a very rough and coarse appearance with a deep red color. The intermixing of this type with other wetland species can cause the color to become more pink or light red. Field verification was used to help map this type.
